

DIMAP[®]
Integrated Inverter
(Autonomous power supply)
Art.-No.: 150197-20

Due to multiple requests of international users we came to the conclusion to develop an internal battery power supply for the DIMAP[®]-scanner.

The design was focused on the possibility to install this feature as a kind of upgrade to all systems already in service.

The inverter and battery charger for 12V /24V and mains operation is entirely integrated in the scanner housing. There are no cabling or other electronic components to be seen from the outside.

To control the feature a membrane switch keyboard is mounted on the topside of the housing. Operation is simple and intuitive. International recognized icons allow operation without depending on local languages.

The internal re-chargeable batteries allow for approximately 20 scan and delete procedures.
